

TYFON®

Equip your vessel with a modern high-performing ship whistling system, built on top of more than 80 years in acoustical engineering for marine applications. Whether it's driven by air or electricity, your TYFON solution is highly customizable to meet your specific requirements – and always backed by our reliable customer support.

Classic Whistles and Complete Acoustic Systems

The TYFON product line provides solutions for every vessel and operational need. Our air-driven whistles use compressed air with low-consumption electropneumatic valves and choke-type regulators, making them compatible with both high- and low-pressure systems. Electrically powered models feature a patented vertically extended front design, directing sound away from the bridge and deck while meeting IMO regulations. These models are equipped with automatic heating to withstand even the harshest marine environments.

TYFON also offers integrated solutions, including sound surveillance systems, signal controllers with GA system interfaces, autonomous signal controllers, and complete ship whistle packages which may include Bell & Gong and maneuvering lights.

Choosing TYFON

With over 1.2 million installations worldwide and decades of continuous development, TYFON offers exceptional clarity, unmatched reliability, and full compliance with IMO and national authority standards.

The future of onboard operation systems

Discover our innovative solutions for all kinds of marine applications, built and perfected over a century. We pair proven technology with modern automation to achieve the most efficient and reliable systems available – made to work flawlessly in the most challenging environments.
